Venue, Resource and Staff Allocation System

Introduction

Event management involves complex coordination of venues, resources and staff. Manual handling of these tasks can lead to errors, conflicts and inefficiency. THe Venue,Resources and Staff Allocation System is developed to automate and simplify this process.
The system allows clients to request events, vendors to allocate resources, staff to view assignments and administrators to control allocation and approvals. It works as a centralised web based system ensuring proper coordination among users.
This system=m supports the organisation objective of efficient event planning, better resources utilization and improves operational management.

Glossary

Admin	User who manages the entire system
Vendor	Provides venues and event resources
Client	User who request and organizes events
Staff	Personnel assigned to events
Resources	Equipments used in events(chair, lights, sound system)
Allocation	Assignment of resources or staff to v=events
Event	A planned function such as wedding or conference

User Requirements

Admin
Manage users, venues and resources.
View reports and system data.

Vendor
Approve or reject the event request and assign staff and resources to events.
Manage available resources.

Client
Create event requests and select the venue and required resources.
View event status.

Staff
View assigned tasks and shall accept or reject it.
Update availability and view work history.

System Requirements

User Authentication
Users can register and authenticate based on their role

Event Management
Client can create event request and select required venue, resources and date
Vendor can approve or reject event request and client to view event status

Venue and Resources Allocation
Admin can modify venues and resources
Allocate venue,resources and prevent double booking of venues and resources

Staff Management
Assign task based on staff availability and staff shall update progress

Non-Functional Requirements

Performance
Process event request and allocation with minimal delay
Support multiple concurrent users

Security
Protect user data using secure authentication
Ensures role based access control

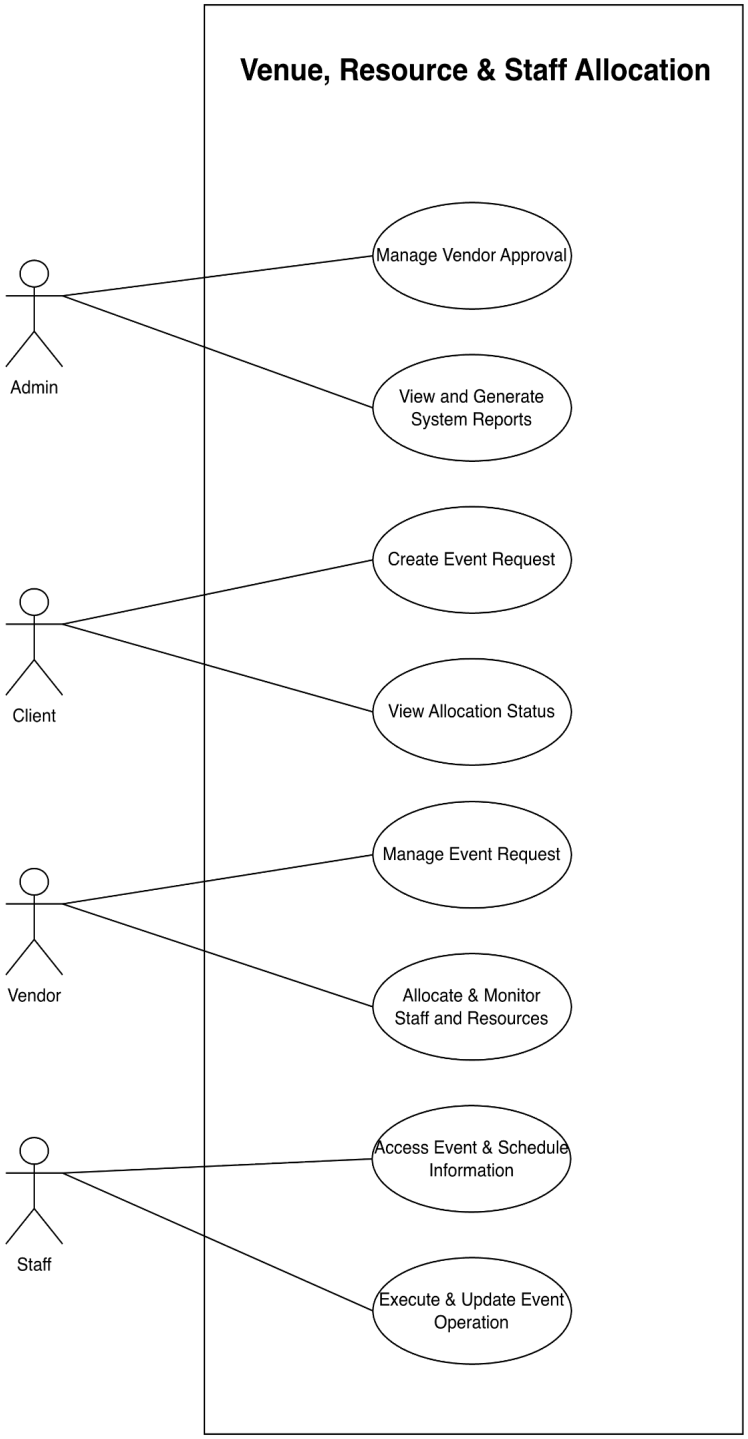

Usability
Have an user friendly interface
Require minimal training fo risers

Scalability
Support an increasing number of users, event and resources
Allow future enhancement without major redesign

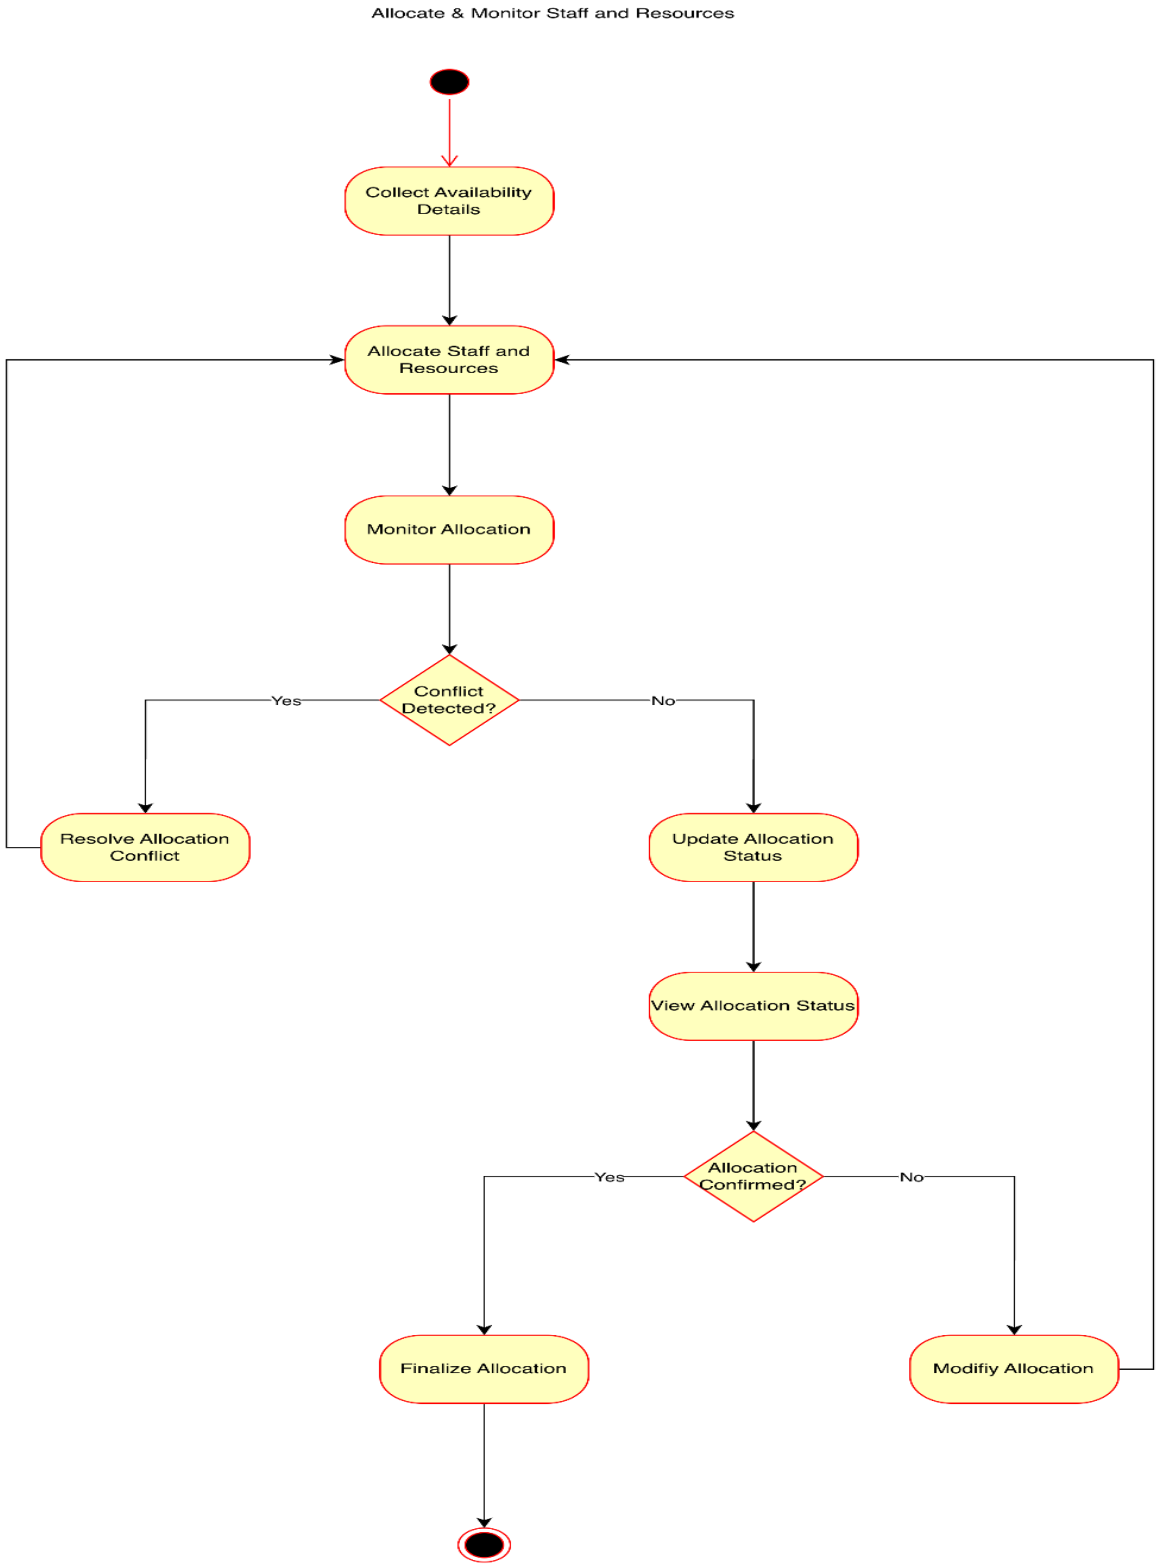

Maintainability
Easy to update and maintain
Support modular upgrades and bug fixes

Dependability
Maintain high availability of system during normal operation
Prevent data loss in case of system failure
